TASKFLOW

Task and Project Management REST API

PROJECT PURPOSE

TaskFlow is a lightweight Node.js + Express backend for managing team tasks.
It supports task assignment, priority, progress tracking, and CRUD operations.

SCENARIO

A software team needs a shared API to create, assign, edit and complete tasks.
This project demonstrates a simple REST-based solution for that workflow.

DATA MODEL

id (UUID), title, description, assignee, project, priority, status,
createdAt, updatedAt. Data is stored locally in data/tasks.json.

API ENDPOINTS

POST /tasks - Create a task (201)
GET /tasks - List all tasks (200)
GET /tasks/:id - Fetch task details (200)
PUT /tasks/:id - Update a task (200)
DELETE /tasks/:id - Delete a task (200)

ARCHITECTURE AND MIDDLEWARE

Node.js, Express.js, modular route/controller/data layers.
Logger middleware records the timestamp, HTTP method, and endpoint.
JSON request/response handling and standard HTTP status codes are included.

TESTING AND DELIVERY

Run npm install, then npm start to serve http://localhost:3000.
Use the included Postman collection for the five required CRUD requests.
Seven Node.js automated tests verify CRUD, errors, and logger behavior.
Actual Postman screenshots must be captured manually for final submission.
